

The coverage is for a handheld radio receiving a signal from the repeater designated. I set the parameters high enough so that getting into the repeater from the green area should be doable for most of the Hams with just a Handheld.

Green is a signal strength is 1.42 uV or greater which means a useable signal that should be available to everyone at least 95% of the time

Yellow is a signal strength of 0.45 to 1.41 uV which is a marginal signal that is available about 95% of the time

No color means no signal.
